We invite you to take part in a research study to test a system that helps youth with concussion return to their sport life (return-to-play).

What is this study about?

Researchers at Holland Bloorview developed an assessment called *R2Play*. We want to test the *R2Play* assessment with youth and young adults so we can understand its value and challenges.

Who can participate?

We are looking for **Health professionals** who:

- 1) Have at least 1 year of experience working with adolescents, and young adults
- 2) Have clinical experience with concussion or other ABI population
- 3) Can communicate fluently in English.

To be eligible for this study, allied health professionals must be able to commit to two training sessions including ~40 minutes of virtual asynchronous modules & 1 hour of in-person training, as well as 2 assessment sessions (~1 hour each) and a follow-up interview (~30 mins).

What's involved?

Participants will fill out a demographic questionnaire, undergo *R2Play* training, administer *R2Play* to youth athletes two times, and participate in a follow up interview via Zoom. The total time commitment for the study is approximately 4-4.5 hours over the course of 4 non-consecutive days. This study may take place during off hours (outside of 9 am to 5 pm) so participating clinicians may need to make time to participate in the study.

What are the potential benefits and risks?

By participating, your feedback will help us assess the cross-site feasibility of the *R2Play* system. Some participants may feel uncomfortable talking in an interview. Participants will receive an honorarium to thank them for their time.
